$\int f(g(x))\,g'(x)\,dx = F(g(x)) + C$, je-li $\int f(y)\,dy = F(y) + C$

a podobně:

$= \frac{1}{2}\int \frac{dy}{y} = \frac{1}{2}\ln y + c = \frac{1}{2}\ln(1+\ln^2 x) + c,\ x \in (0,+\infty)$

nebo, pokud někdo už „vidí" lze substituovat „najednou":

$$\int \frac{\ln x}{x(1+\ln^2 x)}\,dx = \left| \begin{matrix} 1+\ln^2 x = t > 0 \\ 2\ln x \cdot \frac{1}{x}dx = dt \end{matrix} \right| = \frac{1}{2}\int \frac{1}{t}\,dt = \frac{1}{2}\ln t + c$$

$$= \frac{1}{2}\ln(1+\ln^2 x) + c$$

d) $\underline{\int \frac{e^x}{e^{2x}+2e^x+2}\,dx} = \left| \begin{matrix} e^x = t \\ e^x dx = dt \end{matrix} \right| = \int \frac{dt}{t^2+2t+2}\,dt =$

$\left(= -\int \frac{\cos x}{1+\cos^4 x} \cdot (\cos x)'\,dx \right)$ „vidíme" $\left(= -\frac{1}{2}\int \frac{(t^2)'}{1+(t^2)^2}\,dt \right)$

$\left(\begin{matrix} \text{další} \\ \text{substituce} \end{matrix} \right) = \left| \begin{matrix} t^2 = y \\ 2t\,dt = dy \end{matrix} \right| = -\frac{1}{2}\int \frac{dy}{1+y^2} = -\frac{1}{2}\operatorname{arctg} y + c =$

$= -\frac{1}{2}\operatorname{arctg}(\cos^2 x) + c,\ x \in \mathbb{R}$

Také lze hned „substituovat": $\cos^2 x = t$ $(dt = 2\cos x \cdot (-\sin x))$ pokud toto „vidíme".

$$\int \frac{\sin x \cdot \cos x}{2\sin^2 x + 3\cos^2 x}\,dx = -\frac{1}{2}\int \frac{(2\sin^2 x + 3\cos^2 x)'}{2\sin^2 x + 3\cos^2 x}\,dx \overset{*}{=}$$

$$(2\sin^2 x + 3\cos^2 x)' = 4 \cdot \sin x \cdot \cos x - 6\cos x \cdot \sin x = -2\sin x \cdot \cos x$$

$$\overset{*}{=} \underline{-\frac{1}{2}\ln\left(2\sin^2 x + 3\cos^2 x\right) + C, \quad x \in R}$$

a pokud toto „nevidíme", nic se neděje – $\cos^2 x$ lze „vyjádřit" pomocí $\sin^2 x$ a pak substituovat $\sin x = t$, nebo, obráceně, $\sin^2 x$ lze vyjádřit pomocí $\cos^2 x$ a substituovat $\cos x = t$:

$$\int \frac{\sin x \cdot \cos x}{2\sin^2 x + 3(1-\sin^2 x)}\,dx = \int \frac{\sin x}{3-\sin^2 x} \cdot \cos x\,dx \overset{*}{=} \left| \begin{array}{l} \sin x = t \\ \cos x\,dx = dt \end{array} \right|$$

$$= \int \frac{t}{3-t^2}\,dt = \left| \begin{array}{l} 3-t^2 = y \\ -2t\,dt = dy \end{array} \right| = -\frac{1}{2}\int \frac{dy}{y} = -\frac{1}{2}\ln|y| + C$$

$$= -\frac{1}{2}\ln\left(3-\sin^2 x\right) + C, \quad x \in R$$

nebo zde „rychleji" substituovat:

$$\overset{*}{=} \left| \begin{array}{l} 3-\sin^2 x = t \\ -2\sin x \cdot \cos x\,dx = dt \end{array} \right| = -\frac{1}{2}\int \frac{dt}{t} = -\frac{1}{2}\ln|t| + C$$

$$= \underline{-\frac{1}{2}\ln(3-\sin^2 x) + C}$$

analogicky

$$\int \frac{\sin x \cos x}{2\sin^2 x + 3\cos^2 x}\,dx = \int \frac{\cos x \sin x}{2+\cos^2 x}\,dx = \underline{-\frac{1}{2}\ln(2+\cos^2 x) + C}$$

(Poznámka: díky tomu, že všechny tři funkce jsou primitivní k téže funkci v R, liší se v R maximálně o konstantu, zde jsou „stejné".)

- $$\int \frac{\cos^3 x}{2+\sin x}\,dx = \int \frac{\cos^2 x}{2+\sin x}\cdot \cos x\,dx = \int \frac{1-\sin^2 x}{2+\sin x}\cdot\cos x\,dx =$$

$$= \left| \begin{array}{l} \sin x = t \\ \cos x\,dx = dt \end{array} \right| = \int \frac{1-t^2}{2+t}\,dt = -\int \left(t-2+\frac{3}{t+2}\right)dt =$$

po vydělení čitatele jmenovatelem

$$= -\left(\frac{t^2}{2} - 2t + 3\ln|t+2|\right) + C = 2\sin x - \frac{\sin^2 x}{2} - 3\ln(\sin x + 2) + C$$
